

Report:

^ledge

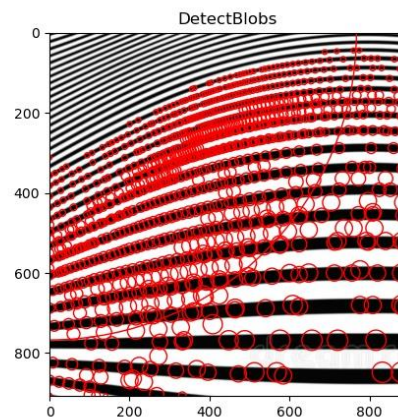

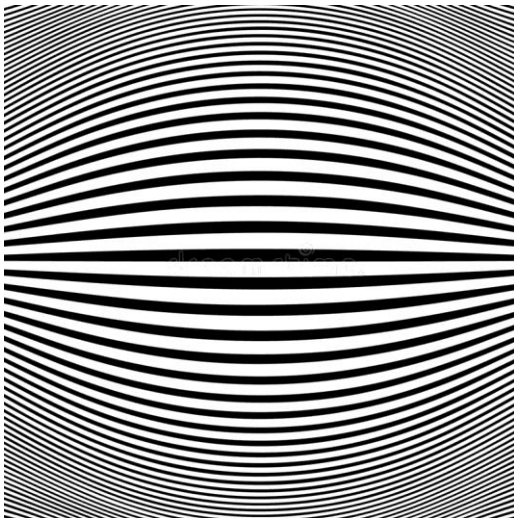

^pier

^hill

^success

^failure.

The failure doesn't correctly assemble the target image. In this case it classifies the third image as an outlier. Additionally, its results are highly variant. (another test run failed to correctly assemble the first and second images.) This is due to the fact that there are a lot of repeated regions that lead to very noisy matching. Additionally, the blob like features detected don't do well to capture the line curvature of this image. Most of the blobs are just uniformly black or white circles within these lines of curvature, so they don't provide any meaningful features for this type of matching.
